PHP AD LDAP Authenticator - Bug # 393: Issue regarding staff login with email address

Status:	New	Priority:	Normal
Author:	Sarbjit Singh	Category:	
Created:	06 Jun 2014	Assignee:	
Updated:	05 Dec 2016	Due date:	
Subject:	Issue regarding staff login with email address		
Description:	LDAP authenticator allows staff to login with account name as well as with email address. This results in creating two staff accounts in Admin CP, which should not be the case.

+1

This project seems dead, but hopefully not... :)

Please do share - we're also plagued with this problem and would love to stop it.

Hi:

This should do it for you. Sorry for the late reply.

./ldap/kayako_ldap.php (~ line 286):

```
@       /**
     * Get user name
     *
     * @return string
     */
    public function getUsername() {
         //If we already have a user name send it back
         if (!empty($this->username)) {
         // Added if statement from test code below to disallow login by e-mail address
             if (KAYAKO_LDAP_STRIP_EMAIL && ($pos = strpos($_POST['username'], '@')) === true) { // Modified to === true so is evaluated correctly
                   $this->username = substr($_POST['username'], 0, $pos);
             } else {
                   $this->username = $_POST['username'];
             }
         return $this->username;
     }
@
```
